### Data on the certified building:

Address of the building: **"LUCIAN BLAGA" THEORETICAL HIGH SCHOOL, BUILDING C1-NORTH, ALEEA BAISOARA NR. 4, LOC. CLUJ-NAPOCA, JUD. CLUJ**

Building category: **CLADIRE DE ÎNVATĂMÂNT**

Height regime: **B+GF+2F**

Year of construction: **1974**

Purpose of drawing up the energy certificate: **INFORMATIONAL**

Heated area: **2151.15 m²**

The heated volume of the building: **7278.06m³**

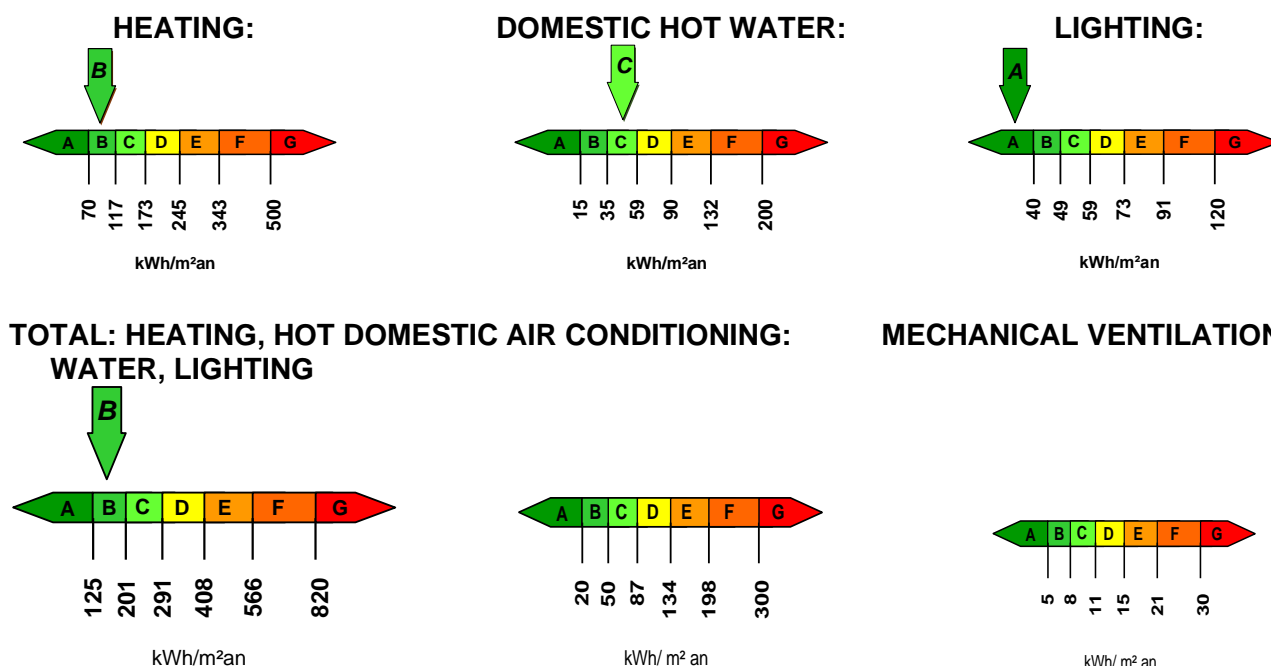

Calculation program used: \_\_\_\_\_, version: \_\_\_\_\_

### Data regarding the identification of the energy auditor for buildings:

Specialty: (c, i, ci)	Name and surname:	Series and number of attestation certificate:	No. and date of registration of the certificate in the auditor's register:	Auditor's signature and stamp:
C+I	LAZARESCU GEORGE-ANTON	SSA/02356	0030/14.06.2022	

# DATA REGARDING THE EVALUATION OF THE ENERGY PERFORMANCE OF THE BUILDING

- Energy classification grids of the building according to the specific annual heat consumption:

- Energy performance of the reference building:

Annual specific energy consumption [kWh/m²year]			Energy rating
for:			<b>96.25</b>
Heating:		77.09	
Domestic hot water:		43.69	
Air conditioning:		-	
Mechanical ventilation:		-	
Lighting:		21.20	

- Penalties granted to the certified building and their motivation:

Penalty coefficient	p
<b>p1 - penalty coefficient depending on the condition of the technical basement of the building - for collective buildings</b>	1.00
Individual building - EDUCATION BUILDING	
<b>p2 - penalty coefficient depending on the use of the entrance door to the building - for collective buildings</b>	1.00
Educational building - the access doors are provided with a locking system.	
<b>p3 - penalty coefficient depending on the state of the movable closing elements in the common spaces (stairwell)</b>	1.00
Windows / doors in good condition and provided with sealing gaskets	
<b>p4 - penalty coefficient depending on the condition of the closing and adjusting fittings from the static bodies - for buildings equipped with a central heating installation with static bodies</b>	1.00
The static bodies are equipped with adjustment fittings and they are functional	
<b>p5 - penalty coefficient depending on the washing / cleaning of the indoor heating installation - for buildings connected to a centralized heating point or district heating plant</b>	1.05
The static bodies were completely dismantled and washed more than three years ago	
<b>p6 - penalty coefficient depending on the existence of fittings for separating and emptying the heating columns - for collective buildings equipped with a central heating installation</b>	1.03

The heating columns are provided with separation fittings and are not functional	<b><i>Translation from Romanian</i></b>
<b>p7 - penalty coefficient depending on the existence of measuring equipment for settling heat consumption - for buildings connected to centralized heat supply systems</b>	
There is neither a general heat meter for heating, nor a general heat meter for domestic hot water, heat consumption being determined in a flat rate system	1.15
<b>p8 - penalty coefficient depending on the condition of the external finishes of the external walls - for buildings with brick walls or BCA</b>	
Good condition of the exterior plaster	1.00
<b>p9 - penalty coefficient depending on the state of the external walls in terms of their moisture content</b>	
Dry exterior walls	1.00
<b>p10 - penalty coefficient depending on the state of the roof over the bridge - for buildings with uninhabitable bridge</b>	
Sealed roof	1.00
<b>p11 - penalty coefficient depending on the condition of the smoke exhaust chimney / chimneys - for buildings equipped with local heating systems / preparation of domestic hot water with liquid or solid fuel</b>	
Another type of building	1.00
<b>p12 - penalty coefficient that takes into account the possibility of ensuring the required fresh air at the comfort value</b>	
Building without organized ventilation system	1.10
<b>Total =<math>\Pi</math>(p1:p12)</b>	<b>1.37</b>

❑ **Recommendations for reducing costs by improving the energy performance of the building:**

- Increasing the corrected thermal resistance of the external walls above the minimum value provided by the technical norms in force, through thermal insulation without changing the external appearance of the building.
- Increasing the corrected thermal resistance of the floor above the last level as well as the screed above the minimum value stipulated by the technical norms in force
- Increasing the corrected thermal resistance of the slab on the ground and the floor above the basement, the minimum value provided by the technical norms in force
- Increasing the thermal resistance of glazed elements above the standard minimum value.

The following related measures are also recommended in order to directly or indirectly increase the energy performance of the educational building:

- Elimination of deposits of organic and inorganic matter from inside the thermal agent pipes and heating bodies by washing and equipping the installation with efficient filters
- The introduction of a surface between the wall and the radiator to reflect the radiant heat to the room
- Thermo-hydraulic balancing of heating bodies, thermal agent columns, distribution network
- Installation of faucets with thermostat on the connection of the heating bodies.
- Restoration of the insulation of the heating agent and domestic hot water distribution pipes.
- Reduction of heat supply during non-occupancy periods of the building
- Ensuring the adjustment of the heating thermal load by room types
- Equipping the domestic hot water installation with fittings provided with water consumption limitation
- Installation of LED bulbs and implementation of a lighting control system.
- Ensuring indoor air quality by implementing ventilation systems with energy recovery simultaneously with reducing cold air infiltration by sealing the joints.
- Ensuring the maintenance of the construction and related installations

**It is recommended to carry out a study on the feasibility of using alternative systems of high efficiency from a technical, economic and environmental point of view.**

*Elaborated,*

**S.C. ZAL INVESTMENTS COMPANY S.A**

**INFORMATION REGARDING THE CERTIFIED BUILDING**  
**Annex to the Energy Performance Certificate no. 0030/14.06.2022**

**1. Construction data:**

- ☐ Building category : ☐ residential, individual ☐ residential with several apartments  
(apartment building) ☐ dormitories, boarding schools ☐ hospitals, polyclinics  
☐ hotels and restaurants ☐ sports buildings  
☐ social-cultural buildings ☒ educational buildings  
☐ other types of energy-consuming buildings
- ☐ No. of floors: ☒ Basement ☐ Semi-basement  
☒ Ground floor ☒ 2 Floors
- ☐ The heated volume of the building: ..... 7278.06 m<sup>3</sup> .....
- ☐ Situation plan / sketch of the apartment indicating the orientation to the cardinal points, the distances to the nearby buildings and their height and the positioning of the heat source or the connection point to the external heat source.

- ☐ Geometrical and thermo technical characteristics of the envelopment:

Corrected thermal resistances					
Building element		A	R	R'	r
		[m²]	[m²K/W]	[m²K/W]	
EXTERIOR WALL		816.75	0.42	0.39	0.93
NON-CIRCULABLE TERRACE		717.05	2.82	2.63	0.93
FLOOR OVER UNHEATED BASEMENT		120.25	0.45	0.43	0.95
FLLOR OVER THE GROUND		596.80	3.03	2.64	0.87
CARPENTRY	PVC	457.28	0.55	0.55	1

## 2. Data regarding the indoor heating system:

- ☐ Energy source for space heating:
- ☐ Own source: *Own thermal power plant*
  - ☐ District heating plant
  - ☒ Heating - central thermal point
  - ☐ Heating – local thermal point
  - ☐ Other or mixed source:
- ☐ Type of heating system:
- ☐ Local heating with stoves,
  - ☒ Central heating with static fixtures,
  - ☐ Hot air central heating,
  - ☐ Central heating with underfloor heating,
  - ☐ Other heating system:
- Calculation heat requirement: **172 000 W**
  - Connection to the centralized heat source ☒ single connection,  
☐ multiple: ..... points,  
☐ not applicable
  - Heat meter: - meter type ..... No .....
    - year of installation .....
    - the existence of the metrological visa .....
  - Thermal and hydraulic adjustment elements:
    - at connection level ..... No
    - at the level of static bodies ..... YES

## 3. Energy source for the preparation of domestic hot water:

- ☐ Energy source for the preparation of domestic hot water:
- ☒ Own source: ..... **Local electric boilers/instant**
  - ☐ District heating plant
  - ☐ Heating - central thermal point
  - ☐ Heating – local thermal point
  - ☐ Other or mixed source: .....
- ☐ Type of domestic hot water preparation system:
- ☐ From centralized source,
  - ☐ Own source: own thermal plant
  - ☐ Boiler with bivalent storage,
  - ☒ Local preparation with instant DHW appliances,
  - ☐ Local preparation on the stove,
  - ☐ Other DHW preparation system: .....

- ☐ Connection to the centralized heat source: ☒ single connection,  
☐ multiple: ..... points,  
☐ not applicable
- ☐ DHW water recirculation pipe: ☐ functional,  
☐ not working  
☒ does not exist
- ☐ General heat meter: - meter type ..... NO .....  
- year of installation .....  
- the existence of the metrological visa .....
- ☐ Flow meters at consumption points: ☒ does not exist  
☐ partially  
☐ everywhere

#### 4. Data regarding the lighting installation:

The calculation was carried out applying the simplified method, with the specification that the interior lighting installation is not provided with a safety lighting system nor with a lighting control system.

$$W_{illum}=6 \times A + (t_u \times \Sigma P_n)/1000= 56804.76 \text{ [kWh/year]}$$

$$t_u=(t_D \times F_D \times F_O) + (t_N \times F_O)= 2000 \text{ [h]}$$

$T_D$  – daylight usage time depending on the type of building

$F_D$  – daylight dependence factor

$F_O$  – the dependence factor on the duration of use

$T_N$  – the time when natural light is not used

$P_N$  – installed power

$A$  – total floor area in the building

$$w_{il}= 21,20 \text{ kWh/m}^2\text{year}$$

## 1. Introduction

This document presents the assessment of the energy performance of the "LUCIAN BLAGA" THEORETICAL HIGH SCHOOL objective, BUILDING C1-NORTH LOCATED IN BAISOARA ALLEY NO. 4, LOC. CLUJ-NAPOCA, JUD. CLUJ, carried out on the basis of data and observations according to the data provided by the beneficiary.

After the general presentation of the evaluated building, the thermal and energy evaluation sheet related to the construction and the heating installation and preparation of domestic hot water was completed.

Finally, the results obtained on the basis of the thermo-energetic assessment of the building and the related heating and hot water preparation installations serve for the energy certification of the building.

The preparation of the building's energy performance certificate was carried out in accordance with the provisions of Methodology Mc 001/2006, regarding the calculation of energy consumption of buildings,

Other related documents are:

- Order no. 2641/2017 regarding the modification and completion of the technical regulation "Methodology for calculating the energy performance of buildings" MC 001-2006
- Law no. 10/1995 regarding quality in construction, with subsequent amendments and additions
- Law no. 372/2005 regarding the energy performance of buildings, with subsequent amendments and additions
- NP 008-97 - Regulations regarding the hygiene of air composition in spaces with various destinations, depending on the activities carried out in the winter-summer regime.
- GT 032-2001 - Guide regarding the procedures for carrying out the measurements necessary for the thermal energy expertise of constructions and related installations.
- C 107/1-2005 - Regulations regarding the calculation of global thermal insulation coefficients for residential buildings.
- C 107/3-2005 - Normative regarding thermotechnical calculation of construction elements of buildings.
- C 107/5-2005 - Regulations regarding the thermotechnical calculation of construction elements in contact with the ground.
- SR 1907/1-2014 - Heating installations. Calculation of heat requirement. Calculation method.
- SR 1907/2-2014 - Heating installations. Calculation of heat requirement. Conventional indoor temperatures for calculation.

## 2. General presentation of the energy assessed building

### 2.1 Elements of architectural composition

The evaluated building is an educational building with a height regime B+GF+2F, located in ALEEA BAISOARA NR. 4, LOC. CLUJ-NAPOCA, CLUJ COUNTY with the ground floor built area of 774.02 m<sup>2</sup>, and the development area of 2317.15 m<sup>2</sup>.

The building has a rectangular plan, the orientation of the main facade of the building is WEST, with the overall maximum dimensions of 44.75 m x 18.01 m.

The existing architectural solution for the building groups the following functions per level:

- Partial basement: technical space
- Ground floor and floors: classrooms, laboratories, administrative offices, sanitary groups and other technical spaces.

The average level heights are:

- basement: 2.00 m
- ground floor: 3.45 m
- 1st floor: 3.45 m
- 2nd floor: 3.25 m

The roof is a non-circulating terrace type, thermally insulated.

The exterior and interior joinery is comprised of white double-glazed PVC windows and doors.

Building finishes:

- The exterior wall finishes are of the plaster-mortar type.
- Interior wall finishes are simple, with washable paint and chipboard paneling, mosaic plasters, and tiled tiling in the bathrooms.
- The floors are made of PVC carpet in the corridor area and mosaic in the staircase area, wooden or laminate parquet in the classrooms and tiles in the bathrooms.

### 2.2 Elemente de alcătuire structurii de rezistență:

The resistance structure of the building is made up as follows:

- Reinforced concrete pillars and beams;
- The external walls are made of prefabricated BA panels, with a thickness of 25 cm.
- horizontal elements – reinforced concrete floors

The infrastructure is made as follows:

- plain concrete structural walls
- slab on the ground made of reinforced concrete
- continuous concrete foundations

The partition walls are mainly made of BCA/brick masonry.

### 2.3 General presentation of the installation systems related to the building:

**Translation from Romanian**

The heating is ensured by the heating agent supply from the city's heating network.

The conventional calculation conditions are fixed by the values:  $T_i=20^{\circ}\text{C}$ ,  $T_e=-18^{\circ}\text{C}$ .

The distribution of the thermal agent is achieved through a bi-tubular system with lower distribution and vertical columns that cross the floors. The heating bodies are made of cast iron and are equipped with shut-off and adjustment valves.

The building is supplied with cold water from the city network and is provided at the level of the branch with flow meters for recording consumption.

Hot water is prepared locally with the help of electric instants.

The lighting of the interior spaces is mostly provided with fluorescent lighting fixtures. The building is not equipped with presence sensors to operate the lighting fixtures or twilight sensors in order to adjust the luminous flux according to the light input.

### 3. Building's expertise sheet

The building: "LUCIAN BLAGA" THEORETICAL HIGH SCHOOL, BUILDING C1-NORTH

Address: ALEEA BAISOARA NR. 4, LOC. CLUJ-NAPOCA, CLUJ COUNTY

- ☐ Main destination of the building:
- |                                 |                                  |   |

- ✓ Carpentry condition:
- ☒ good
  - ☐ without sealing measures (wooden carpentry)
  - ☒ with sealing gaskets (PVC carpentry)
  - ☐ with special sealing measures

- ☒ Mobile construction elements in the common spaces:
- ✓ Entrance doors to the building:
    - ☒ door is equipped with an automatic closing system
    - ☐ the door is not equipped with an automatic closing system and remains closed when not in use
  - ✓ Windows related to unheated spaces - the condition of the windows, the carpentry and the degree of sealing:
    - ☒ windows / doors in good condition and fitted with seals
    - ☐ windows / doors in good condition but leaky
    - ☐ windows / doors in poor condition, missing or broken

- ☐ Characteristics of the living / heated space:

Construction element	Type	R <sub>j</sub>	S
		[m <sup>2</sup> K/W]	[m <sup>2</sup> ]
Carpentry	PVC	0,55	457,28

- ✓ Floor area of the heated space: 2151.15 m<sup>2</sup>
- ✓ The volume of the heated space: 7278.06 m<sup>3</sup>

- ☐ Degree of occupancy of the heated space / no. of operating hours of the heating installation:

- 12 hours/day during the week at calculation temperature: 20°C
- Weekends and the holiday period at low temperature: 12°C

- ☐ Indoor heating system:

- ✓ Energy source for space heating:
  - ☐ own source, with gaseous fuel: THERMAL PLANT
  - ☐ district heating plant
  - ☒ heating - central thermal point
  - ☐ heating – local thermal point
  - ☐ other source or mixed source
- ✓ Type of heating system:
  - ☐ local heating with stoves
  - ☒ central heating with static fixtures
  - ☐ hot air central heating
  - ☐ central heating with underfloor heating
  - ☐ other heating system

- ☐ Data regarding the indoor heating installation with static bodies (evaluation):

### Translation from Romanian

- ✓ Type of distribution of the thermal heating agent:
  - ☐ lower
  - ☐ upper
  - ☒ mixed
  - ☐ not applicable
- ✓ Calculation heat requirement: 172 000 W
- ✓ Heat meter: NU
- ✓ Thermal and hydraulic adjustment elements (at the column level): NO
- ✓ Thermal and hydraulic adjustment elements (at the level of static bodies): NO
- ☒ The static bodies are equipped with adjustment fittings and they are functional
- ☐ Static bodies are equipped with adjustment fittings, but at least a quarter of them are not functional
- ☐ Static bodies are not equipped with adjustment fittings or at least half of the existing adjustment fittings are not functional
- ☐ Data regarding the domestic hot water installation:
  - ✓ Energy source for preparing domestic hot water:
    - ☒ Own source: **Local electric boilers/instant**
    - ☐ District heating plant
    - ☐ Heating - central thermal point
    - ☐ Heating – local thermal point
    - ☐ Other or mixed source:
  - ✓ Type of domestic hot water preparation system:
    - ☐ From centralized source
    - ☐ Own thermal plant
    - ☐ Storage boiler
    - ☒ Local preparation with instant DHW.
    - ☐ Local cooking on the stove
    - ☐ Other DHW preparation system
  - ✓ DHW recirculation pipe:
    - ☐ functional in the basement
    - ☐ does not work
    - ☒ does not exist
  - ✓ Heat meter: Not applicable
  - ✓ Flow meters at consumption points: not the case
  - ✓ Other information:
    - accessibility to the hot water connection: YES
    - invoices for natural gas consumption for buildings with their own hot water production installation. operating on natural gas: Not applicable
    - cold water temperature 10°C
    - average number of people: 496
- ☐ Data regarding the lighting installation:

**Translation from Romanian**

The calculation was carried out applying the simplified method, with the specification that the interior lighting installation is not provided with a safety lighting system nor with a lighting control system.

$$W_{\text{ilum}} = 6 \times A + (t_u \times \Sigma P_n) / 1000 = 45604.38 \text{ [kWh/year]}$$

$$t_u = (t_D \times F_D \times F_O) + (t_N \times F_O) = 2000 \text{ [h]}$$

$T_D$  – daylight usage time depending on the type of building

$F_D$  – daylight dependence factor

$F_O$  – the dependence factor on the duration of use

$T_N$  – the time when natural light is not used

$P_N$  – installed power

$A$  – total floor area in the building

$$w_{il} = 21,20 \text{ kWh/m}^2\text{an}$$

## 4. Evaluation of the energy performance of the building

### 4.1 Expert report

#### 4.1.1 General information

<b>Building</b>	LUCIAN BLAGA" THEORETICAL HIGH SCHOOL, BUILDING C1-NORTH
<b>Address</b>	ALEEA BAISOARA NR. 4, LOC. CLUJ-NAPOCA, CLUJ COUNTY
<b>The main destination of the building</b>	Education
<b>Building type</b>	Individual
<b>Year of construction</b>	1974
<b>Constructive structure</b>	Pillars and beams from BA + Walls from prefabricated panels

Geometric characteristics of the envelopment:

#### Exterior carpentry:

#### Opaque exterior walls:

Construction element	Orientation	Surface	Construction element	Orientation	Surface
	-	m <sup>2</sup>		-	m <sup>2</sup>
<i>0</i>	<i>1</i>	<i>2</i>	<i>0</i>	<i>1</i>	<i>2</i>
Exterior carpentry	SOUTH	60.22	Exterior wall	SOUTH	122.58
	NORTH	58.59		NORTH	124.21
	EAST	210.33		EAST	243.88
	WEST	128.14		WEST	326.08

#### 4.1.2 Information regarding the heating installation

Energy source for space heating	The city heating network
Type of heating system	Heating installation with static bodies
Distribution of the heating agent	Mixed
Calculation heat requirement (W)	172 000
Connection to centralized heat source	Yes
Heat meter for heating	No
Thermal and hydraulic adjustment elements	No

## 4.2 Energy calculations - Real Building

### 4.2.1 Thermal resistances, reduction coefficients, corrected thermal resistances

Corrected thermal resistances					
Building element		A	R	R'	r
		[m <sup>2</sup> ]	[m <sup>2</sup> K/W]	[m <sup>2</sup> K/W]	
EXTERIOR WALL		816.75	0.42	0.39	0.93
NON-CIRCULABLE TERRACE		717.05	2.82	2.63	0.93
FLOOR OVER UNHEATED BASEMENT		120.25	0.45	0.43	0.95
FLOOR PLATE		596.80	3.03	2.64	0.87
CARPENTRY	PVC	457.28	0.55	0.55	1

### 4.2.2 Surface and average corrected thermal resistance of the building envelope

- Total area of the building envelope:.....2708.13 (m<sup>2</sup>)
- Corrected average thermal resistance of the building envelope:.....0.73 (m<sup>2</sup>°K/W)

### 4.2.3 Calculation data

#### a) conventional temperatures

- thermal zone: III
- wind zone: IV
- temperature indoor: 20 °C
- temperature outside: -18 °C

#### b) reference temperatures necessary for the calculation of energy consumption

- calculation temperature:  $\left\{ \begin{array}{l} 20 \text{ °C} - 12 \text{ h/day during the week} \\ 12 \text{ °C} - \text{at night, on weekends and during vacation periods} \end{array} \right.$
- average temperature of the heating period:  $t_{em} = 1.69 \text{ °C}$

#### c) The duration of the heating period of the actual building

The duration of the heating period represents the number of days in which the heating installation must operate to maintain the internal temperature at a constant value, taking into account energy inputs and free heat sources inside and outside the building.

Heating duration: Dz = 183 (days)

### Translation from Romanian

#### 4.2.4 Annual heat consumption for heating

- $Q_{f,h}$  annual energy consumption for heating the building: 311599.91 (kWh/year)

To calculate the value of the annual heat consumption at the level of energy supply to the building, the following values were used:

- $H_T$  transmission heat loss coefficient: 3921.06 (W/K)
- $H_v$  heat loss coefficient through ventilation: 3955.29 (W/K)
- $Q_L$  heat losses of the building: 358450.97 (kWh)
- $Q_g$  total heat input: 200406.59 (kWh)
- $D_{zreal}$  actual duration of heating period: 183 (zile)
- $Q_h$  heat requirement for heating a building: 231999.58 (W)

#### 4.2.5 Specific annual heat consumption for heating

- la nivelul furnizării energiei: 144.85(kWh/m<sup>2</sup>year)

#### 4.2.6 Specific annual heat consumption for the preparation of domestic hot water

- at the level of energy supply: 14.90 (kWh/m<sup>2</sup>year)

A number of 496 people and a consumption of 5 [l/pers/day] of water at a temperature of 60°C, during the period of occupation of the building, were considered.

#### 4.2.7 Annual specific energy consumption for lighting

- at the level of energy supply: 21.20 (kWh/m<sup>2</sup>year)

#### 4.2.8 Total specific annual heat consumption

- at the level of energy supply: 180.95(kWh/m<sup>2</sup>year)

#### 4.2.9 CO<sub>2</sub> emissions: 41.48(kgCO<sub>2</sub>/m<sup>2</sup>year)

### 4.3 Energy calculations - The reference building

In the case of the reference building, the surface of the windows and exterior walls is identical to that of the real building. The thermal resistances of the envelope elements take the minimum recommended values from the point of view of thermal protection of the building. These changes lead to new values for the length of the heating season and the corrected number of degree-days.

The total penalty coefficient given to the reference building is 1.

#### 4.3.1 Surface and average corrected thermal resistance of the building envelope

- Total envelopment surface:.....2708.13 (m<sup>2</sup>)
- Corrected average thermal resistance of the building envelope:.....1.98 (m<sup>2</sup>K/W)

#### 4.4.2 Heating duration and corrected number of degree days

- Heating duration:..... 172 (days);

#### 4.4.3 Annual heat consumption for heating

- at the level of energy supply:.....165828.69 (kWh/year)

#### 4.4.4 Specific annual heat consumption for heating

- at the level of energy supply:.....77.09 (kWh/m<sup>2</sup>year)

#### 4.4.5 Specific annual heat consumption for hot water preparation

- at the level of energy supply:.....43.69 (kWh/m<sup>2</sup>year)

#### 4.4.6 Specific energy consumption for lighting:.....21.20 (kWh/m<sup>2</sup>.year)

#### 4.4.7 Total specific annual heat consumption

- at the level of energy supply:.....141.98(KWh/m<sup>2</sup>year)

#### 4.4.8 CO<sub>2</sub> emissions:.....32.91(kgCO<sub>2</sub>/m<sup>2</sup>year)
